DESIGN JUSTIFICATION

1.1. Design Goals and Target Users

Hobit is designed primarily for university students who want to organize and maintain their daily habits. The main goal of the application is to provide a simple and accessible experience that allows users to create habits, schedule reminders and monitor their progress.

The interface focuses on making the main actions easy to understand and complete. Since users may interact with the application regularly, the design aims to reduce unnecessary steps and provide a clear navigation structure. The visual elements are kept simple to avoid distracting users from their daily habit-tracking activities.

1.2. Color Palette

The Hobit interface uses a soft green-based color palette to create a calm and comfortable visual experience. Light green tones are used for the main background, while darker green tones provide contrast and emphasize important interface elements.

The primary color is **#2C6658**, used for the logo, primary buttons and selected interface elements. The secondary color is **#E9F1E9**, used for secondary buttons and subtle highlights. The background color is **#EDF4EE**, while **#FCFCFA** is used for the form cards and **#F3F7F1** for the input fields.

The use of consistent colors across the application helps users recognize important actions and maintain a visually unified experience. The green-based palette also supports the application's focus on personal growth, consistency and positive daily habits.

1.3. Typography

The application uses a clean and readable typography style to make habit names, instructions, form labels and reminder information easy to understand.

The selected typeface is **Inter**. Bold font weights are used for screen titles, section headings and important messages, while regular font weights are used for descriptions, labels and supporting information. Inter was selected for its clean appearance and readability, helping maintain a consistent visual hierarchy throughout the application.

Different font sizes establish a visual hierarchy and help users distinguish between primary information and secondary details. This approach supports readability and keeps the interface organized.

1.4. Layout and Navigation

The application follows a simple and card-based layout structure. Light-colored cards are used to separate related information and organize form elements. This structure helps users focus on individual tasks without making the interface visually crowded.

The authentication screen provides email and password fields, a login button, a Google sign-in option and a link for users who want to create an account. It also includes a short introductory message explaining the purpose of hobit.

The habit creation process is divided into two steps. In the first step, users enter a habit name and select a starting date using a calendar interface. In the second step, they choose the repetition frequency and set a reminder time.

This two-step structure separates habit information from scheduling preferences. It helps users complete the creation process in a more organized way and prevents too many input fields from appearing on a single screen.

The application uses consistent buttons, input fields, cards and spacing throughout its screens. Primary actions, such as continuing to the next step and saving a habit, are visually emphasized to make the expected user actions clear.

1.5. Accessibility and Usability

Accessibility and usability are considered important aspects of the hobit design. The interface uses clear labels, readable text and visually distinguishable buttons to help users understand the available actions.

Form fields include descriptive labels and example placeholders to guide users when entering information. The calendar and reminder time selector provide visual selection states so users can easily identify their current choices.

The design also aims to maintain sufficient contrast between text, backgrounds and interactive elements. Important information is not communicated through color alone, and interactive elements should have appropriately sized touch areas for mobile use.

The application will be tested on available Android and iOS devices to identify potential layout and usability issues across different screen sizes.

1.6. Design Consistency and Project Goals

The visual design of hobit supports its main objective of helping users build and maintain personal habits. The authentication screen provides a clear entry point, while the two-step habit creation process allows users to define their habits and scheduling preferences in an organized way.

Consistent colors, typography, cards and button styles help create a unified experience across the application. The planned habit-tracking screen will continue this visual approach by presenting daily habits and their completion status clearly.

Overall, the design prioritizes simplicity, readability and ease of interaction to provide a practical habit-tracking experience for university students.
